

POWER BOOST™

SEED ENHANCEMENT

PowerBoost is the latest addition to Ampac's line up of quality seed products. *PowerBoost* is an all natural seed coating designed to increase germination, survivability and promote early root development. *PowerBoost* works as a soil amendment that can reduce moisture stress by absorbing available water and holding that water for use by the plant root. *PowerBoost* also improves the efficiency of applied nutrients (Nitrogen, Phosphorous and Potassium) by holding them near the root for the plant to readily access.

- Enhanced Viability
- Faster establishment
- Uniformity of crop development
- Improved yields and quality
- Reduced stress due to heat and drought

By optimizing a plant's use of available water, *PowerBoost* promotes fast and uniform seedling emergence, improves stand establishment and helps plants avoid stress caused by heat and drought. *PowerBoost* can stay active 12 months to several years, depending on the soil. *PowerBoost* is not organic-certified.

So give your plants a *PowerBoost* to a healthy stand. Check with your local distributor for *PowerBoost* added products and application information.

Ampac would advise coated seed be planted in a timely manner and not be carried over from season to season to ensure germ viability. Ampac also highly recommends that coated seed be used in blends. This is a precautionary measure until we can establish hard information that carryover seed maintains a reliable germ. *PowerBoost* contains Zeba.
